### ABSTRACT

In this paper we introduce a new class of sets namely  $\alpha g^{**}$ -closed sets which is settled properly in between the class of  $\alpha$ -closed and the class of  $g^{**}$ -closed sets. The notion of the  $\alpha g^{**}$ -continuous maps and  $\alpha g^{**}$ -irresolute maps are introduced and certain results regarding the above said maps are found.  $T_{\alpha}^{**}$ -space and  ${}^*T_{\alpha}^{*}$ -space are introduced and studied.

**Keywords:**  $\alpha g^{**}$ -closed set,  $\alpha g^{**}$ -continuous map,  $\alpha g^{**}$ -irresolute maps,  $T_{\alpha}^{**}$ -spaces ;

${}^*T_{\alpha}^{*}$ -spaces

---

### 1.INTRODUCTION

Levine [8] introduced the class of generalized closed sets, a super class of closed sets in 1970. Andrijevic[1] defined semi- pre-open sets in 1986. Dontchev[6] introduced on generalizing semi- pre-open sets in 1995. Balachandran[3], Sundaram and Maki introduced on generalized continuous maps in topological spaces in 1991. Arya[2] and Nour defined Characterizations of s-normal spaces in 1990. Pauline Mary Helen [13], PonnuthaiSelvarani and Veronica Vijayan introduced  $g^{**}$ -closed sets in topological spaces in 2012. Veerakumar[14] defined  $g^{*}$ -closed sets in 1996.

Levine [9], Njasted[12] introduces semi- open sets, pre-open sets,  $\alpha$ -closed sets. The complement of a semi-open (resp. pre-open,  $\alpha$ -open, semi- pre-open) set in 1963. Maki [11], Devi and Balachandran defined associated topologies of generalized  $\alpha$ -closed sets and  $\alpha$ -generalized closed sets in 1994. Devi [4], Maki and Balachandran introduced Semi-

generalized closed maps and generalized closed maps in 1993. Gnanbambal [7] defined on generalized pre regular closed sets in topological spaces in 1997. Devi [5], Maki and Balachandran introduced Semi-generalized homeomorphisms and generalized semi-homeomorphism in topological spaces in 1995. We proved that  $g^{**}$ -closedness is independent from  $\alpha g^{**}$ -closedness. Applying  $\alpha g^{**}$ -closed sets, two new spaces namely,  $T\alpha^{**}$ -spaces and  $*T_{\alpha}^{**}$ -spaces are introduced. Maragathavalli[10] and Sheik Jhon introduced on  $s\alpha g^{**}$ -closed sets in topological spaces in 2005.

## 2.Preliminaries

Throughout this paper  $(X, \tau)$ ,  $(Y, \sigma)$  and  $(Z, \eta)$  represent non- empty topological spaces on which no separation axioms are assumed unless otherwise mentioned. For a subset  $A$  of a space  $(X, \tau)$ ,  $cl(A)$  and  $int(A)$  denote the closure and the interior of  $A$  respectively.

**Definition 2.1:** A subset  $A$  of a topological space  $(X, \tau)$  is called

- 1) a semi-open set [9] if  $A \subseteq cl(int(A))$  and semi-closed set if  $int(cl(A)) \subseteq A$ .
- 2) a semi-pre-open set [1] if  $A \subseteq cl(int(cl(A)))$  and semi-pre closed set [1] if  $int(cl(int(A))) \subseteq A$ .
- 3) an  $\alpha$ -open set if  $A \subseteq int(cl(int(cl(A))))$  and an  $\alpha$ -closed set [12] if  $cl(int(cl(A))) \subseteq A$ .

**Definition 2.2:** A subset  $A$  of a topological space  $(X, \tau)$  is called

- 1) a generalized closed set (briefly  $g$ -closed) [8] if  $cl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ .
- 2) a generalized semi-closed set (briefly  $gs$ -closed) [2] if  $scl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ .
- 3) a  $\alpha$  generalized closed set (briefly  $\alpha g$ -closed) [11] if  $\alpha cl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ .

- 4) a generalized  $*$  closed set (briefly  $g^*$ -closed) [14] if  $cl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $g$ -open in  $(X, \tau)$ .
- 5) a generalized  $**$  closed set (briefly  $g^{**}$ -closed) [13] if  $cl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $g^*$ -open in  $(X, \tau)$ .
- 6) a generalized semi-pre closed set (briefly  $gsp$ -closed) [9] if  $spcl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is open in  $(X, \tau)$ .
- 7) a semi  $\alpha$  generalized  $*$  closed set (briefly  $s\alpha g^*$ -closed)[10] if  $\alpha cl(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $g^*$ -open in  $(X, \tau)$ .

**Definition 2.3:** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called

- 1) a continuous if the inverse image of every closed set in  $(Y, \sigma)$  is closed in  $(X, \tau)$ .
- 2) an  $\alpha g$  – continuous [7] if the inverse image of every closed set in  $(Y, \sigma)$  is  $\alpha g$  – closed in  $(X, \tau)$ .
- 3)  $ags$ -continuous [5] if the inverse image of every closed set in  $(Y, \sigma)$  is  $gs$ -closed in  $(X, \tau)$ .
- 4)  $agsp$ -continuous [6] if the inverse image of every closed set in  $(Y, \sigma)$  is  $gsp$ -closed in  $(X, \tau)$ .
- 5) a  $g^*$ -continuous [14] if the inverse image of every closed set in  $(Y, \sigma)$  is  $g^*$ -closed in  $(X, \tau)$ .
- 6) a  $s\alpha g^*$ -continuous [14] if the inverse image of every closed set in  $(Y, \sigma)$  is  $s\alpha g^*$ -closed in  $(X, \tau)$ .
- 7) a  $g^*$  –irresolute [14] if the inverse image of every  $g^*$ -closed set in  $(Y, \sigma)$  is  $g^*$ -closed in  $(X, \tau)$ .

**Definition 2.4:** A topological space  $(X, \tau)$  is said to be

- 1) a  $T_{1/2}$   $^*$ -space [14] if every  $g^*$ -closed set in  $(X, \tau)$  is closed in  $(X, \tau)$ .
- 2) an  $_{\alpha}T_c$  - space [14] if every  $\alpha g$  - closed set in  $(X, \tau)$  is  $g^*$ -closed in  $(X, \tau)$ .
- 3) a  $T_b$  - space [4] if every  $g$ -closed set in  $(X, \tau)$  is closed in  $(X, \tau)$ .
- 4) a  $_{\alpha}T_b$  - space [11] if every  $\alpha g$  - closed set in  $(X, \tau)$  is closed in  $(X, \tau)$ .
- 5) a  $_{\alpha}T_b$  - space [3] if every  $\alpha g$  - closed set in  $(X, \tau)$  is closed in  $(X, \tau)$ .

### 3. Basic properties of $\alpha g^{**}$ -closed sets

We now introduce the following definition.

**Definition 3.1:** A subset  $A$  of  $(X, \tau)$  is said to be a  $\alpha g^{**}$ -closed set if  $\text{acl}(A) \subseteq U$  whenever  $A \subseteq U$  and  $U$  is  $g^{**}$ -open in  $X$ .

The class of  $\alpha g^{**}$ -closed subset of  $(X, \tau)$  is denoted by  $\alpha g^{**}C(X, \tau)$ .

**Proposition 3.2:** Every closed set is  $\alpha g^{**}$ -closed.

Proof follows from the definition.

The converse of the above proposition need not be true in general as seen in the following example.

**Example 3.3:** Let  $X = \{a, b, c\}$  and  $\tau = \{\Phi, X, \{b\}, \{b, c\}\}$ . Let  $A = \{c\}$ , then  $A$  is  $\alpha g^{**}$ -closed but not closed.

So, the class of  $\alpha g^{**}$ -closed set is properly contained in the class of closed sets.

**Proposition 3.4:** Every  $g^*$ -closed set is  $\alpha g^{**}$ -closed.

Proof follows from the definition.

The converse of the above proposition need true and in general it can be seen from the following example.

**Example 3.5:** Let  $X = \{a, b, c\}$ ,  $\tau = \{\Phi, X, \{a\}, \{a, b\}\}$ . Let  $A = \{b\}$  is  $\alpha g^{**}$ -closed but not  $g^{*}$ -closed.

**Proposition 3.6:** Every  $\alpha g^{**}$ -closed set is  $gs$ -closed.

Proof follows from the definition.

The converse of the above proposition need true and in general it can be seen from the following example.

**Example 3.7:** Let  $X = \{a, b, c\}$ ,  $\tau = \{\Phi, X, \{a\}, \{b, c\}\}$ . let  $A = \{c\}$  &  $\{a, c\}$  is  $gs$ -closed but not  $\alpha g^{**}$ -closed.

**Proposition 3.8:** Every  $\alpha g^{**}$ -closed set is  $\alpha g$ -closed.

Proof follows from the definition.

The converse of the above proposition need true and in general it can be seen from the following example.

**Example 3.9:** Let  $X = \{a, b, c\}$ ,  $\tau = \{\Phi, X, \{a\}, \{b, c\}\}$ . let  $A = \{a, c\}$  is  $\alpha g$ -closed but not  $\alpha g^{**}$ -closed.

**Proposition 3.10:** Every  $\alpha g^{**}$ -closed set is  $gsp$ -closed.

Proof follows from the definition.

The converse of the above proposition need true and in general it can be seen from the following example.

**Example 3.11:** Let  $X = \{a, b, c\}$ ,  $\tau = \{\Phi, X, \{a\}\}$ . Let  $A = \{a, c\}$  then  $A$  is  $gsp$ -closed but not  $\alpha g^{**}$ -closed.

**Proposition 3.12:** Every  $\alpha g^{**}$ -closed set is  $sag^{*}$ -closed.

Proof follows from the definition.

The converse of the above proposition need true and in general it can be seen from the following example.

**Example 3.13:** Let  $X = \{a, b, c\}$ ,  $\tau = \{\Phi, X, \{a\}, \{b, c\}\}$ . let  $A = \{b\}$  is  $\text{sag}^*$ -closed but not  $\alpha g^{**}$ -closed.

**Theorem 3.14:** For each  $x \in X$  either  $\{x\}$  is  $g^{**}$ -closed (or)  $\{x\}^c$  is  $\alpha g^{**}$ -closed in  $X$ .

**Proof:** If  $\{x\}$  is not  $g^{**}$ -closed then the only  $g^{**}$ -open set containing  $\{x\}^c$  is  $X$ .

$\therefore \alpha cl\{x\}^c \subseteq X$  and hence  $\{x\}^c$  is  $\alpha g^{**}$ -closed.

**Theorem 3.15:**  $A$  is a  $\alpha g^{**}$ -closed set of  $(X, \tau)$  if  $\alpha cl(A) \setminus A$  does not contains any non-empty  $g^{**}$ -closed set.

**Proof:** Let  $F$  be a  $g^{**}$ -closed set of  $(X, \tau)$  such that  $F \subseteq \alpha cl(A) \setminus A$ . Then  $A \subseteq X \setminus F$  since  $A$  is  $\alpha g^{**}$ -closed and  $X \setminus F$  is  $g^{**}$ -open,  $\alpha cl(A) \subseteq X \setminus F$ . This implies  $F \subseteq X \setminus \alpha cl(A)$  so  $F \subseteq (X \setminus \alpha cl(A)) \cap (\alpha cl(A) \setminus A) \subseteq (X \setminus \alpha cl(A)) \cap \alpha cl(A) = \emptyset \Rightarrow F = \emptyset$

**Remark 3.16:**  $g^{**}$ -closedness and  $\alpha g^{**}$ -closedness are independent.

In example (3.5)  $A = \{b\}$  is  $\alpha g^{**}$ -closed but not  $g^{**}$ -closed.

In example (3.10)  $A = \{c\}$  is  $g^{**}$ -closed but not  $\alpha g^{**}$ -closed.

The above results can be represented in the following figure.

Where  $A \rightarrow B$  (resp.  $A \leftrightarrow B$ ) represents  $A$  implies  $B$  (resp.  $A$  &  $B$  are independent)

#### 4. $\alpha g^{**}$ -CONTINUOUS MAPS AND $\alpha g^{**}$ -IRRESOLUTE MAPS.

We now introduce the following definitions.

**Definition 4.1:** A map  $f : (X, \tau) \rightarrow (Y, \sigma)$  from a topological space  $(X, \tau)$  to a topological space  $(Y, \sigma)$  is called  $\alpha g^{**}$ -continuous if the inverse image of every closed set in  $(Y, \sigma)$  is  $\alpha g^{**}$ -closed in  $(X, \tau)$ .

**Theorem 4.2:** Every continuous map is  $\alpha g^{**}$ -continuous.

**Proof:** Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  be continuous. Let  $F$  be closed set in  $(Y, \sigma)$  then  $f^{-1}(F)$  is closed in  $(X, \tau)$ . Since every closed set is  $\alpha g^{**}$ -closed,  $f^{-1}(F)$  is  $\alpha g^{**}$ -closed in  $(X, \tau)$ .

$\therefore f$  is  $\alpha g^{**}$ -continuous in  $(X, \tau)$ .

The converse of the above theorem need not be true and in general it can be seen from the following example.

**Example 4.3:** Let  $X=Y = \{a,b,c\}$ ,  $\tau = \{\Phi, X, \{a,b\}\}$ ,  $\sigma = \{\Phi, Y, \{a\}\}$   $f : (X, \tau) \rightarrow (Y, \sigma)$  is defined as the identity map. The inverse image of all the closed sets in  $(Y, \sigma)$  are  $\alpha g^{**}$ -closed in  $(X, \tau)$ . But  $f^{-1}(\{b,c\}) = \{b,c\}$  is not closed in  $(X, \tau)$ . Therefore  $f$  is  $\alpha g^{**}$ -continuous but not continuous.

**Theorem 4.4:** Every  $g^*$ -continuous map is  $\alpha g^{**}$ -continuous.

**Proof:** Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  be  $g^*$ -continuous. Let  $F$  be closed set in  $(Y, \sigma)$  then  $f^{-1}(F)$  is  $g^*$ -closed in  $(X, \tau)$ . Since every  $g^*$ -closed set is  $\alpha g^{**}$ -closed,  $f^{-1}(F)$  is  $\alpha g^{**}$ -closed in  $(X, \tau)$ .  $\therefore f$  is  $\alpha g^{**}$ -continuous in  $(X, \tau)$ .

The converse of the above theorem need not be true and in general it can be seen from the following example.

**Example: 4.5:** Let  $X = Y = \{a,b,c\}$  and  $\tau = \{X, \Phi, \{a\}, \{a,b\}\}$ ,  $\sigma = \{Y, \Phi, \{b,c\}, \{a\}\}$ .  $f : (X, \tau) \rightarrow (Y, \sigma)$  is defined as  $f(a)=b$ ;  $f(b)=a$ ;  $f(c)=c$ . The inverse image of all the closed sets in  $(Y, \sigma)$

are  $\alpha g^{**}$ -closed in  $(X, \tau)$ . But  $f^{-1}(\{a\}) = \{b\}$  is not  $g^*$ -closed in  $(X, \tau)$ . Therefore  $f$  is  $\alpha g^{**}$ -continuous but not  $g^*$ -continuous.

**Theorem 4.6:** Every  $\alpha g^{**}$ -continuous map is  $gs$ -continuous.

**Proof:** Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  be  $\alpha g^{**}$ -continuous. Let  $F$  be closed set in  $(Y, \sigma)$  then  $f^{-1}(F)$  is  $\alpha g^{**}$ -closed in  $(X, \tau)$ . Since every  $\alpha g^{**}$ -closed set is  $gs$ -closed,  $f^{-1}(F)$  is  $\alpha g^{**}$ -closed in  $(X, \tau)$ .  $\therefore f$  is  $gs$ -continuous in  $(X, \tau)$ .

The converse of the above theorem need not be true and in general it can be seen from the following example.

**Example: 4.7:** Let  $X = Y = \{a, b, c\}$  and  $\tau = \{X, \Phi, \{a\}, \{b, c\}\}, \sigma = \{Y, \Phi, \{a\}, \{a, b\}\}$ .  $f : (X, \tau) \rightarrow (Y, \sigma)$  is defined as  $f(a)=b; f(b)=c; f(c)=a$ . The inverse image of all the closed sets in  $(Y, \sigma)$  are  $gs$ -closed in  $(X, \tau)$ . But  $f^{-1}(\{c\}) = \{b\}$  is not  $\alpha g^*$ -closed in  $(X, \tau)$ . Therefore  $f$  is  $gs$ -continuous but not  $\alpha g^{**}$ -continuous.

**Theorem: 4.8** Every  $\alpha g^{**}$ -continuous map is  $\alpha g$ -continuous.

**Proof:** Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  be  $\alpha g^{**}$ -continuous. Let  $F$  be closed set in  $(Y, \sigma)$  then  $f^{-1}(F)$  is  $\alpha g^{**}$ -closed in  $(X, \tau)$ . Since every  $\alpha g^{**}$ -closed set is  $\alpha g$ -closed,  $f^{-1}(F)$  is  $\alpha g$ -closed in  $(X, \tau)$ .  $\therefore f$  is  $\alpha g$ -continuous in  $(X, \tau)$ .

The converse of the above theorem need not be true and in general it can be seen from the following example.

**Example: 4.9:** Let  $X = Y = \{a, b, c\}$  and  $\tau = \{X, \Phi, \{a\}, \{b, c\}\}, \sigma = \{Y, \Phi, \{a\}\}$ .  $f : (X, \tau) \rightarrow (Y, \sigma)$  is defined as  $f(a)=c; f(b)=a; f(c)=b$ . The inverse image of all the closed sets in  $(Y, \sigma)$  are  $\alpha g$ -closed in  $(X, \tau)$ . But  $f^{-1}(\{b, c\}) = \{a, c\}$  is not  $\alpha g^*$ -closed in  $(X, \tau)$ . Therefore  $f$  is  $\alpha g$ -continuous but not  $\alpha g^{**}$ -continuous.

**Theorem: 4.10:** Every  $\alpha g^{**}$ -continuous map is  $gsp$ -continuous.

**Proof:** Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  be  $\alpha g^{**}$ -continuous. Let  $F$  be closed set in  $(Y, \sigma)$  then  $f^{-1}(F)$  is  $\alpha g^{**}$ -closed in  $(X, \tau)$ . Since every  $\alpha g^{**}$ -closed set is  $gsp$ -closed,  $f^{-1}(F)$  is  $gsp$ -closed in  $(X, \tau)$ .  $\therefore f$  is  $gsp$ -continuous in  $(X, \tau)$ .

The converse of the above theorem need not be true and in general it can be seen from the following example.

**Example 4.11:** Let  $X = Y = \{a, b, c\}$  and  $\tau = \{X, \Phi, \{a\}\}, \sigma = \{Y, \Phi, \{a\}, \{b, c\}\}$ .

$f : (X, \tau) \rightarrow (Y, \sigma)$  is defined as the identity map. The inverse image of all the closed sets in  $(Y, \sigma)$  are  $gsp$ -closed in  $(X, \tau)$ . But  $f^{-1}(\{b, c\}) = \{a, c\}$  is not  $\alpha g^*$ -closed in  $(X, \tau)$ . Therefore  $f$  is  $gsp$ -continuous but not  $\alpha g^{**}$ -continuous.

**Theorem 4.12:** Every  $\alpha g^{**}$ -continuous map is  $s\alpha g^*$ -continuous.

**Proof:** Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  be  $\alpha g^{**}$ -continuous. Let  $F$  be closed set in  $(Y, \sigma)$  then  $f^{-1}(F)$  is  $\alpha g^{**}$ -closed in  $(X, \tau)$ . Since every  $\alpha g^{**}$ -closed set is  $s\alpha g^*$ -closed,  $f^{-1}(F)$  is  $s\alpha g^*$ -closed in  $(X, \tau)$ .  $\therefore f$  is  $s\alpha g^*$ -continuous in  $(X, \tau)$ .

The converse of the above theorem need not be true and in general it can be seen from the following example.

**Example 4.13:** Let  $X = Y = \{a, b, c\}$  and  $\tau = \{X, \Phi, \{a\}, \{b, c\}\}, \sigma = \{Y, \Phi, \{a\}\}$ .

$f : (X, \tau) \rightarrow (Y, \sigma)$  is defined as  $f(a)=c; f(b)=a; f(c)=b$ . The inverse image of all the closed sets in  $(Y, \sigma)$  are  $s\alpha g^*$ -closed in  $(X, \tau)$ . But  $f^{-1}(\{b, c\}) = \{a, c\}$  is not  $\alpha g^*$ -closed in  $(X, \tau)$ . Therefore  $f$  is  $s\alpha g^*$ -continuous but not  $\alpha g^{**}$ -continuous.

We now introduce the following definition.

**Definition 4.14:** A function  $f : (X, \tau) \rightarrow (Y, \sigma)$  is said to be  $\alpha g^{**}$ -irresolute if the inverse image of every  $\alpha g^{**}$ -closed set in  $(Y, \sigma)$  is  $\alpha g^{**}$ -closed in  $(X, \tau)$

**Theorem 4.15:** Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  and  $g : (Y, \sigma) \rightarrow (Z, \eta)$  be any two functions then,

- (i)  $g \circ f : (X, \tau) \rightarrow (Z, \eta)$  is  $\alpha g^{**}$ -continuous if  $f$  is  $\alpha g^{**}$ -irresolute and  $g$  is  $\alpha g^{**}$ -continuous.
- (ii)  $g \circ f : (X, \tau) \rightarrow (Z, \eta)$  is  $\alpha g^{**}$ -irresolute if  $f$  and  $g$  are  $\alpha g^{**}$ -irresolute.
- (iii)  $g \circ f : (X, \tau) \rightarrow (Z, \eta)$  is  $\alpha g^{**}$ -continuous if  $f$  is  $\alpha g^{**}$ -irresolute and  $g$  is continuous.

Proof follows from the definitions.

**Theorem 4.16:** Every  $g^*$ -irresolute map is  $\alpha g^{**}$ -continuous

Proof follows from the definitions.

The above results can be represented in the following figure.

Where  $A \rightarrow B$  (resp.  $A \rightleftarrows B$ ) represents  $A$  implies  $B$  (resp.  $A$  &  $B$  are independent)

## 5. APPLICATIONS OF $sg^{**}$ -CLOSED SET.

As applications of  $\alpha g^{**}$ -closed sets, new spaces namely,  $T_{\alpha}^{**}$ -space and  ${}^*T_{\alpha}$ -space are introduced.

We introduce the following definitions.

**Definition 5.1:** A space  $(X, \tau)$  is said to be  $T_{\alpha}^{**}$ -space, if every  $\alpha g^{**}$ -closed set in  $(X, \tau)$  is closed in  $(X, \tau)$ .

**Definition 5.2:** A space  $(X, \tau)$  is said to be  ${}^*T_\alpha$ -space, if every  $\alpha g^{**}$ -closed set in  $(X, \tau)$  is  $g^*$ -closed in  $(X, \tau)$ .

**Theorem 5.3:** Every  $T_\alpha^{**}$ -space is  $T_{1/2}^*$ -space but not conversely.

Proof follows from the definitions.

The converse of the above theorem need not be true in general as seen in the following example.

**Example 5.4:** In example (3.11), where  $X = \{a, b, c\}$   $\tau = \{\emptyset, X, \{a\}\}$  every  $g^*$ -closed set is closed.  $\therefore (X, \tau)$  is a  $T_{1/2}^*$ -space. In this space  $\{b\}$  is  $\alpha g^{**}$ -closed but not closed in  $(X, \tau)$ .

Therefore every  $\alpha g^{**}$ -closed set is not closed in  $(X, \tau) \therefore (X, \tau)$  is not a  $T_\alpha^{**}$ -space.

**Theorem 5.5:** Every  $T_{1/2}^*$ -space and  ${}_aT_c$ -space is  $T_\alpha^{**}$ -space.

Proof follows from the definitions.

**Theorem 5.6:** Every  $T_b$ -space is  $T_\alpha^{**}$ -space.

Proof follows from the definitions.

**Theorem 5.7:** Every  ${}_aT_b$ -space is  $T_\alpha^{**}$ -space.

Proof follows from the definitions.

**Theorem 5.8:** Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  be a  $\alpha g^{**}$ -continuous map. If  $(X, \tau)$  is  $T_\alpha^{**}$ -space then  $f$  is continuous.

**Proof:** Let  $f : (X, \tau) \rightarrow (Y, \sigma)$  be  $\alpha g^{**}$ -continuous. Let  $F$  be closed in  $(Y, \sigma)$  then since  $f$  is  $\alpha g^{**}$ -continuous  $f^{-1}(F)$  is  $\alpha g^{**}$ -closed in  $(X, \tau)$ . Also since  $(X, \tau)$  is a  $T_\alpha^{**}$ -space,  $f^{-1}(F)$  is closed in  $(X, \tau)$ .

The inverse image  $f^{-1}(F)$  is closed in  $(X, \tau) \therefore f$  is continuous.

**Theorem 5.9:** Every  ${}_aT_c$ -space is  ${}^*T_\alpha$ -space.

**Proof:** Let  $(X, \tau)$  be  ${}_aT_c$  - space Let A be  $\alpha g^{**}$ -closed in  $(X, \tau)$

Then by proposition (3.8), A is  $\alpha g$ -closed set in  $(X, \tau)$  and since  $(X, \tau)$  is  ${}_aT_c$  - space , A is  $g^*$ -closed in  $(X, \tau)$  Therefore every  $\alpha g^{**}$ -closed set in  $(X, \tau)$  is  $g^*$ -closed in  $(X, \tau) \therefore (X, \tau)$  is  ${}^*T_\alpha^*$  - space .

**Theorem 5.10:** Every  $T_c$  - space is  ${}^*T_\alpha^*$  - space .

Proof follows from the definition.
