### Abstract

The purpose of this paper is to define anew kinds of contra – continuous functions which is called contra  $\alpha$ ps – continuous functions. As well as , we will introduce other types of contra  $\alpha$ ps – continuous functions which are ( $\alpha$ ps<sup>#</sup> – continuous functions and  $\alpha$ ps<sup>##</sup> – continuous functions) in topological spaces .Also, we will give some of its fundamental properties and discuss the relationships among these functions.

### Keywords:-

$\alpha$ ps – closed sets ,  $\alpha$ ps – open sets,  $\alpha$ ps – continuous functions , contra- continuous.

### 1- Introduction :-

The notion of contra – continuous functions have been introduced and investigated by Dontchv J. [2] . Recently anew weaker form of this class of function called contra g-continuous functions is introduced And investigated by Caldas.M , Jafari .S , Noiri .T , Simeos.T[4] .In 2014, Dunya M. Hamed [3] introduced and studied  $\alpha$ ps – closed sets and also introduce the notion ( $\alpha$ ps – continuous ,  $\alpha$ ps – irresolute and strongly  $\alpha$ ps – continuous) functions .

In this paper , we introduce and investigate some types of Contra – continuous which are (contra  $\alpha$ ps – continuous functions ,  $\alpha$ ps<sup>#</sup> – continuous functions and  $\alpha$ ps<sup>##</sup> – continuous functions) .Further , we discuss some properties of these functions.

Throughout this paper  $(X, \tau)$  ,  $(Y, \rho)$  and  $(Z, \delta)$  (or simply  $X$  ,  $Y$  and  $Z$ ) represent non-empty topological spaces . For a sub set  $K$  of a space .  $cl(K)$  ,  $int(K)$  and  $K^c$  denoted the closure of  $K$ , the interior of  $K$  and the complement of  $K$  respectively.

### 2. Preliminaries:-

**Definition (2-1) :-** A subset  $K$  of a space  $X$  is said to

- 1- Semi-preopen [1] if  $K \subseteq cl(int(cl(K)))$  and semi-preclosed if  $int(cl(int(K))) \subseteq K$  .
- 2- regular open [13] if  $K = int(cl(K))$  and regular closed if  $K = cl(int(K))$  .
- 3- regular  $\alpha$ -open [ 14] if there is a regular open set  $L$  such that  $L \subseteq K \subseteq \alpha cl(L)$  .

The semi-pre closure of sub set  $K$  of  $X$  is the intersection of all semi-pre closed sets containing  $K$  and denoted by  $spcl(K)$ .

**Definition (2-2) :** A sub set  $K$  of a space is said to be :

- 1- generalized closed set ( briefly , g- closed ) [7] if  $cl(K) \subseteq L$  whenever  $K \subseteq L$  and  $L$  is an open set in .
- 2- regular generalized closed set ( briefly , rg- closed ) [10] if  $cl(K) \subseteq L$  whenever  $K \subseteq L$  and  $L$  is a regular open set .
- 3- regular pre-semi closed ( briefly , rps-closed ) [8] if  $spcl(K) \subseteq L$  whenever  $K \subseteq L$  and  $L$  is an rg- open set in .
- 4-  $\alpha$ ps-closed set [3] if  $\alpha cl(K) \subseteq L$  whenever  $K \subseteq L$  and  $L$  is a rps-open set in

The complement of  $g$ -closed (resp.  $rg$ -closed,  $rps$  – closed and  $\alpha rps$  – closed) sets is called a  $g$ -open (resp.  $rg$ -open,  $rps$ - open and  $\alpha rps$  – open )sets ,  
The class of all  $g$ -closed [ resp.  $\alpha rps$ -closed ] subsets of  $X$  is denoted by  $GC(X, \tau)$ [ resp.  $\alpha RPSC(X, \tau)$  ] .

**Remark (2-3),[3]:**

Every closed (resp. open) set in  $X$  is  $\alpha rps$ – closed (resp.  $\alpha rps$ –open) set.

**Definition (2-4),[7] :**

A topological space  $X$  is said to be  $T_{1/2}$  - space if every  $g$ - closed sets is closed.

**Proposition (2-5) ,[3 ] :**

A topological space  $X$  is said to be  $T_{1/2}^*$  –space if every  $\alpha rps$  – closed (resp.  $\alpha rps$  – open ) sets is closed (resp. open) set.

**Definition (2-7):** A function  $f : (X, \tau) \rightarrow (Y, \sigma)$  is said to be:

- 1- continuous function [6] if the inverse image of each open( closed) set in  $Y$  is an open(closed) set in  $X$  .
- 2-  $\alpha rps$  –continuous [3] if  $f^{-1}(K)$  is  $\alpha rps$ – closed (resp.  $\alpha rps$ - open) set in  $X$  , for every closed (resp . open) set  $K$  in  $Y$  .
- 3-  $\alpha rps$  –irresolute continuous[3] if  $f^{-1}(K)$  is an  $\alpha rps$  –closed (resp.  $\alpha rps$  – open) set in  $X$  , for every  $\alpha rps$  – closed (resp.  $\alpha rps$  –open) set  $K$  in  $Y$  .
- 4- strongly  $\alpha rps$  –continuous[3] if  $f^{-1}(K)$  is closed (resp. open) set in  $X$  , for every  $\alpha rps$  –closed (resp.  $\alpha rps$  –open) set  $K$  in  $Y$  .
- 5- Contra-continuous [2] if  $f^{-1}(K)$  is closed set in  $X$  , for every open set  $K$  in  $Y$  .
- 6- Contra  $g$  -continuous[4] if  $f^{-1}(K)$  is  $g$ - closed set in  $X$  , for every open set  $K$  in  $Y$  .

**3-Main Results :**

In this section ,we introduce and define new kinds of contra -continuous functions namely contra  $\alpha rps$  –continuous functions and other types of contra  $\alpha rps$ –continuous.

**Definition (3-1):**

A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called **contra  $\alpha rps$ - continuous function** if the inverse image of each open set in  $Y$  is  $\alpha rps$  –closed set in  $X$  .

**Example(3-2):-**Let  $X = \{u, v, w\}$  with the topology  $\tau = \{X, \phi, \{u\}, \{v, w\}\}$  , we define  $f : (X, \tau) \rightarrow (X, \tau)$  by  $f(u)=u$  ,  $f(v)=v$  and  $f(w)=w$  ,it is observe that  $f$  is contra  $\alpha rps$ -continuous function.

**Proposition(3-3):**

A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is contra  $\alpha rps$  – function iff  $f^{-1}(K)$  is  $\alpha rps$  –open set in  $X$  , for every closed set  $K$  in  $Y$  .

**Proof :**

Suppose that  $f$  is contra  $\alpha rps$  –continuous function and let  $K$  be a closed set in  $Y$  Then,  $K^c$  is an open set in  $Y$ , since  $f$  is contra  $\alpha rps$  –continuous . Thus,  $f^{-1}(K^c)$  is  $\alpha rps$  –closed set in  $X$  . But  $f^{-1}(K^c) = -f^{-1}(K) = (f^{-1}(K))^c$ . Hence,  $f^{-1}(K)$  is an  $\alpha rps$  –open set in  $X$  . Conversely, let  $K$  be an open set in  $Y$ . Then  $K^c$  is closed set in  $Y$ . By assumption  $f^{-1}(K^c)$  is  $\alpha rps$  –open set in  $X$  . But  $f^{-1}(K^c) = -f^{-1}(K) = (f^{-1}(K))^c$ . Hence,  $f^{-1}(K)$  is a closed set in  $X$  . Therefore ,  $f$  is contra  $\alpha rps$  –continuous function .

**Proposition(3-4):-**

$f: (X, \tau) \rightarrow (Y, \sigma)$  is contra-continuous function, then  $f$  is contra  $\alpha$ ps –continuous.

**Proof :-** It clear from the definition of contra-continuous and fact that every closed set is  $\alpha$ ps –closed .

The converse of above proposition need not be true as seen from the following example .

**Example(3-5):-** Let  $X=Y= \{u, v, w\}$  with the topologies  $\tau = \{X, \phi, \{u\}\}$  and  $\rho = \{Y, \phi, \{u\}, \{u, w\}\}$  , let  $f: (X, \tau) \rightarrow (Y, \rho)$  define by  $f(u)=v$  ,  $f(v)=u$  and  $f(w)=w$  , clearly  $f$  is contra  $\alpha$ ps –continuous , but  $f$  is not contra-continuous , since for the open set  $K = \{u\}$  in  $Y$  , but  $f^{-1}(K) = f^{-1}(\{u\}) = \{v\}$  is not closed set in  $X$  .

The following proposition give the condition in order to make proposition(3-4) true:

**Proposition (3-6):**

iff :  $(X, \tau) \rightarrow (Y, \rho)$  is contra  $\alpha$ ps –continuous and  $X$  is  $T^*_{1/2}$  –space, then  $f$  is contra continuous.

**Proof :-**

Let  $K$  be an open set in  $Y$  . Thus ,  $f^{-1}(K)$  is  $\alpha$ ps –closed set in  $X$  . By hypotheses  $X$  is  $T^*_{1/2}$  –space, then by proposition(2-5) we get ,  $f^{-1}(K)$  is closed set in  $X$  . Therefore ,  $f$  is contra continuous function .

**Remark (3-7):**

The concept of contra g-continuous function is independent to concept contra  $\alpha$ ps –continuous function . As shows in the following examples:

**Example (3-8):**

(i) Let  $X=Y= \{u, v, w\}$  with the topologies  $\tau = \{X, \phi, \{v\}, \{u, w\}\}$  and  $\rho = \{Y, \phi, \{v\}\}$  . Let  $f: (X, \tau) \rightarrow (Y, \rho)$  be function define by  $f(u)=v$  ,  $f(v)=u$  and  $f(w)=w$  , clearly  $f$  is contra g-continuous function but is not contra  $\alpha$ ps –continuous , since for the open set  $K = \{v\}$  in  $Y$  , but  $f^{-1}(K) = f^{-1}(\{v\}) = \{u\}$  is not  $\alpha$ ps – closed set in  $X$  .

(ii) Let  $X=Y= \{u, v, w\}$  with the topologies  $\tau = \{X, \phi, \{u\}, \{u, w\}\}$  and  $\rho = \{Y, \phi, \{u\}, \{v\}, \{u, v\}\}$  . Let  $f: (X, \tau) \rightarrow (Y, \rho)$  by  $f(u)=w$  ,  $f(v)=u$  and  $f(w)=v$  , clearly  $f$  is contra  $\alpha$ ps –continuous function but is not contra g-continuous , since for the open set  $K = \{v\}$  in  $Y$  , but  $f^{-1}(K) = f^{-1}(\{v\}) = \{w\}$  is not g- closed set in  $X$  .

The following propositions give the condition to make Remark(3-7) true:

**Proposition (3-9):**

Let  $f: (X, \tau) \rightarrow (Y, \rho)$  be a contra g-continuous function and  $(X, \tau)$  is  $T_{1/2}$  – space , then  $f$  is contra  $\alpha$ ps –continuous .

**Proof:**

Let  $K$  be an open set in  $Y$  . Thus ,  $f^{-1}(K)$  is g –closed set in  $X$  . By hypotheses  $X$  is  $T_{1/2}$  –space, then by proposition(2-6) step-i- we get  $f^{-1}(K)$  is  $\alpha$ ps –closed in  $X$  . Therefore ,  $f$  is contra  $\alpha$ ps –continuous function .

**Similarly, we proof the following proposition :**

**Proposition (3-10):**

Let  $f: (X, \tau) \rightarrow (Y, \rho)$  be contra  $\alpha$ ps –continuous function and  $(X, \tau)$  is  $T^*_{1/2}$  –space, then  $f$  is contrag –continuous .

Now , we will define other types of contra  $\alpha$ ps –continuous functions namely (contra  $\alpha$ ps<sup>#</sup> –continuous function and contra  $\alpha$ ps<sup>##</sup> –continuous function) .

**Definition (3-11):**

A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called **contra  $\alpha$ ps<sup>#</sup> –continuous function** if the inverse image of each  $\alpha$ ps-open set  $G$  in  $Y$  is  $\alpha$ ps –closed set in  $X$ .

**Example(3-12):-**

Let  $X=Y=\{u, v, w\}$  with the topologies  $\tau=\{X, \phi, \{u\}, \{v\}, \{v, w\}\}$  and  $\rho=\{Y, \phi, \{u\}\}$ , define  $f: (X, \tau) \rightarrow (Y, \rho)$  by  $f(u)=v$ ,  $f(v)=w$  and  $f(w)=u$ , it is observe that  $f$  is contra  $\alpha$ ps<sup>#</sup> –continuous function.

**Proposition(3-13):**

A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is contra  $\alpha$ ps<sup>#</sup> –continuous function if and only if  $f^{-1}(G)$  is  $\alpha$ ps- open set in  $X$ , for every  $\alpha$ ps-closed set  $G$  in  $Y$ .

**Proof :** The proof is similar to the proof of proposition(3-3).

**Proposition(3-14):-**

If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is contra  $\alpha$ ps<sup>#</sup> –continuous function then  $f$  is contra  $\alpha$ ps –continuous

**Proof :**

Let  $K$  be an open set in  $Y$ , since [ every open set is  $\alpha$ ps-open set], then  $K$  is  $\alpha$ ps –open set in  $Y$ . Thus,  $f^{-1}(K)$  is an  $\alpha$ ps-closed set in  $X$ . Therefore,  $f$  is contra  $\alpha$ ps –continuous function.

the converse of proposition (3-14) need not be true in general the following example to show :

**Example (3-15):** Let  $X=Y=\{u, v, w\}$  with the topologies  $\tau = \{X, \phi, \{u\}, \{u, w\}\}$  and  $\rho=\{Y, \phi, \{u\}\}$ , and define  $f: (X, \tau) \rightarrow (Y, \rho)$  by  $f(u)=v$ ,  $f(v)=u$  and  $f(w)=w$  clearly,  $f$  is contra  $\alpha$ ps –continuous function, but  $f$  is not contra  $\alpha$ ps<sup>#</sup> –continuous, since for the  $\alpha$ ps-open set  $K=\{u, v\}$  in  $Y$ , but  $f^{-1}(K) = f^{-1}(\{u, v\}) = \{u, v\}$  is not  $\alpha$ ps –closed set in  $X$ .

The following proposition give the condition to make proposition(3-14) true:

**Proposition (3-16):**

iff :  $(X, \tau) \rightarrow (Y, \rho)$  is contra  $\alpha$ ps –continuous and  $Y$  is  $T^*_{1/2}$  –space, then  $f$  is contra  $\alpha$ ps<sup>#</sup> –continuous.

**Proof :**

Let  $K$  be an  $\alpha$ ps-open set in  $Y$ . By hypotheses  $Y$  is  $T^*_{1/2}$  –space, then by proposition(2-5) we get,  $K$  is an open set in  $Y$ . Also, since  $f$  is contra  $\alpha$ ps –continuous, hence  $f^{-1}(K)$  is  $\alpha$ ps-closed set in  $X$ . Therefore,  $f$  is contra  $\alpha$ ps<sup>#</sup> –continuous function.

**Remark(3-17):**

The concept of contra continuous is independent to concept contra  $\alpha$ ps<sup>#</sup> –continuous function. As shows in the following examples:

**Example (3-18):-**

(i) Let  $X=Y=\{u, v, w\}$  with the topologies  $\tau=\{X, \phi, \{u\}\}$  and  $\rho=\{Y, \phi, \{u\}, \{v\}, \{u, v\}\}$ . Let  $f: (X, \tau) \rightarrow (Y, \rho)$  be function define by  $f(u)=w$ ,  $f(v)=u$  and  $f(w)=u$ , clearly  $f$  is contra  $\alpha$ ps<sup>#</sup> –continuous but  $f$  is not contra continuous, since for the open set  $K = \{u\}$  in  $Y$ , but  $f^{-1}(K) = f^{-1}(\{u\}) = \{v\}$  is not closed set in  $X$ .

(ii) Let  $X=Y=\{u, v, w\}$  with the topologies  $\tau=\{X, \phi, \{u\}, \{v, w\}\}$  and  $\rho=\{Y, \phi, \{u\}\}$ . Let  $f: (X, \tau) \rightarrow (Y, \rho)$  be function define by  $f(u)=u$ ,  $f(v)=v$  and  $f(w)=w$ , clearly  $f$  is contra continuous but  $f$  is not contra  $\alpha$ ps<sup>#</sup> –continuous, since for the  $\alpha$ ps- open set  $K = \{1, 2\}$  in  $Y$ , but  $f^{-1}(K) = f^{-1}(\{1, 2\}) = \{1, 2\}$  is not  $\alpha$ ps-closed set in  $X$ .

The following proposition give the condition to make Remark(3-17) is true:

**Proposition (3-19):**

iff :  $(X, \tau) \rightarrow (Y, \rho)$  is contra  $\alpha$ -continuous and  $Y$  is  $T^*_{1/2}$ -space, then  $f$  is contra  $\alpha$ -continuous.

**Proof :**

Let  $K$  be an  $\alpha$ -open set in  $Y$ . By hypotheses  $Y$  is  $T^*_{1/2}$ -space, then by proposition(2-5) we get,  $K$  is an open set in  $Y$ . Hence,  $f^{-1}(K)$  is closed set in  $X$  and by Remark(2-3) we get, then  $f^{-1}(K)$  is  $\alpha$ -closed set in  $X$ . Therefore,  $f$  is contra  $\alpha$ -continuous function.

Similarly, we proof the following proposition.

**Proposition (3-20):**

iff :  $(X, \tau) \rightarrow (Y, \rho)$  is contra  $\alpha$ -continuous and  $X$  is  $T^*_{1/2}$ -space, then  $f$  is contra  $\alpha$ -continuous.

**Definition (3-21):**

A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called **contra  $\alpha$ -continuous function** if the inverse image of each  $\alpha$ -open set  $G$  in  $Y$  is closed set in  $X$ .

**Example(3-22):-**

Let  $X = \{u, v, w\}$  with the topologies  $\tau = \{X, \phi, \{v\}, \{u, w\}\}$  and  $f: (X, \tau) \rightarrow (X, \tau)$  by  $f(u)=u$ ,  $f(v)=v$  and  $f(w)=w$ , it is observe that  $f$  is contra  $\alpha$ -continuous function.

**Proposition(3-23):**

A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is contra  $\alpha$ -continuous function if and only if  $f^{-1}(G)$  is open set in  $X$ , for every  $\alpha$ -closed set  $G$  in  $Y$ .

**Proof :** The proof is similar to the proof of proposition(3-3).

**Proposition(3-24):-** If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is contra  $\alpha$ -continuous function, then  $f$  is

- (i) Contra - continuous.
- (ii) Contra  $\alpha$ -continuous.
- (iii) Contra  $\alpha$ -continuous function

**Proof(i) :** Let  $K$  be an open set in  $Y$ , since [every open set is  $\alpha$ -open set], then  $K$  is  $\alpha$ -open set in  $Y$ . Also, since  $f$  is contra  $\alpha$ -continuous function. Thus,  $f^{-1}(K)$  is closed set in  $X$ . Therefore,  $f$  is contra-continuous function.

**The proof of step -ii- and -iii- are similar to step-i-.**

The converse of proposition (3-24) need not be true in general the following examples to show :

**Example (3-25):-** Let  $X=Y = \{u, v, w\}$  with the topologies  $\tau = \{X, \phi, \{u\}, \{v, w\}\}$  and  $\rho = \{Y, \phi, \{u\}\}$ , and define  $f: (X, \tau) \rightarrow (Y, \rho)$  by  $f(u)=u$ ,  $f(v)=w$  and  $f(w)=v$ , clearly  $f$  is contra continuous (resp. contra  $\alpha$ -continuous) function, but  $f$  is not contra  $\alpha$ -continuous function, since for the  $\alpha$ -open set  $K = \{u, w\}$  in  $Y$ , but  $f^{-1}(K) = f^{-1}(\{u, w\}) = \{u, v\}$  is not closed (resp.  $\alpha$ -closed) set in  $X$ .

**Example (3-26):-** Let  $X=Y = \{u, v, w\}$  with the topologies  $\tau = \{X, \phi, \{u\}, \{u, w\}\}$  and  $\rho = \{Y, \phi, \{u\}\}$ . Let  $f: (X, \tau) \rightarrow (Y, \rho)$  define by  $f(u)=v$ ,  $f(v)=w$  and  $f(w)=u$ , clearly  $f$  is contra  $\alpha$ -continuous, but  $f$  is not contra continuous (resp. contra  $\alpha$ -continuous) function, since for the open (resp.  $\alpha$ -open) set  $K = \{u\}$  in  $Y$ , but  $f^{-1}(K) = f^{-1}(\{u\}) = \{w\}$  is not closed set in  $X$ .

The following proposition give the condition to make proposition(3-24) are true:

**Proposition (3-27):** A function  $f : (X, \tau) \rightarrow (Y, \rho)$  is contra  $\alpha\text{RPS}^{\# \#}$ -continuous if

- (i)  $f$  is contra-continuous and  $Y$  is  $T^*_{1/2}$ -space.
- (ii)  $f$  is contra  $\alpha\text{RPS}$ -continuous and  $Y$  is  $T^*_{1/2}$ -space.
- (iii)  $f$  is contra  $\alpha\text{RPS}^{\#}$ -continuous and  $X$  is  $T^*_{1/2}$ -space.

**Proof (i):** Let  $K$  be an  $\alpha\text{RPS}$ -open set in  $Y$ . By hypotheses  $Y$  is  $T^*_{1/2}$ -space, then by proposition (2-5) we get,  $K$  is an open set in  $Y$ . Also, since  $f$  is contra-continuous. Hence,  $f^{-1}(K)$  is closed set in  $X$ . Therefore,  $f$  is contra  $\alpha\text{RPS}^{\# \#}$ -continuous function.

The proof of step –ii- and –iii- are similar to step-i-.

**Remark (3-28):**

The composition of two contra  $\alpha\text{RPS}$ -continuous functions need not be contra  $\alpha\text{RPS}$ -continuous function, the following example to show that:

**Example (3-29):**

Let  $X=Y=Z=\{u, v, w\}$  with the topologies  $\tau = \{X, \phi, \{u\}, \{v\}, \{u, v\}\}$ ,  $\rho = \{Y, \phi, \{u\}, \{u, w\}\}$  and  $\mu = \{Z, \phi, \{u\}\}$ , where  $\alpha\text{RPS}(X, \tau) = \{X, \phi, \{w\}, \{u, w\}, \{v, w\}\}$  and  $\alpha\text{RPS}(Y, \rho) = \{Y, \phi, \{v\}, \{w\}, \{v, w\}\}$ . Define  $f : (X, \tau) \rightarrow (Y, \rho)$  by  $f(u)=v$ ,  $f(v)=w$  and  $f(w)=u$  and  $g : (Y, \rho) \rightarrow (Z, \mu)$  by  $g(u)=v$ ,  $g(v)=u$  and  $g(w)=w$  clearly  $f$  and  $g$  are contra  $\alpha\text{RPS}$ -continuous functions, but  $g \circ f : (X, \tau) \rightarrow (Z, \mu)$  is not contra  $\alpha\text{RPS}$ -continuous, since for the open set  $K = \{u\}$  in  $Z$ ,  $(g \circ f)^{-1}(K) = f^{-1}(g^{-1}(K)) = f^{-1}(g^{-1}(\{u\})) = f^{-1}(\{v\}) = \{u\}$  is not  $\alpha\text{RPS}$ -closed set in  $X$ .

**Proposition (3-30):-** Let  $f : (X, \tau) \rightarrow (Y, \rho)$  and  $g : (Y, \rho) \rightarrow (Z, \mu)$  be any functions. Then,  $g \circ f : (X, \tau) \rightarrow (Z, \mu)$  is contra  $\alpha\text{RPS}$ -continuous function if

- (i)  $f$  is contra  $\alpha\text{RPS}$ -continuous function and  $g$  is continuous function.
- (ii)  $f$  is contra  $\alpha\text{RPS}$ -continuous function and  $g$  is strongly  $\alpha\text{RPS}$ -continuous function.

**Proof (i):**

Let  $K$  be an open set in  $Z$ , since  $g$  is continuous function. Thus  $g^{-1}(K)$  is an open set in  $Y$ . Also, since  $f$  is contra  $\alpha\text{RPS}$ -continuous function, then  $f^{-1}(g^{-1}(K)) = (g \circ f)^{-1}(K)$  is  $\alpha\text{RPS}$ -closed set in  $X$ . Therefore,  $g \circ f : (X, \tau) \rightarrow (Z, \mu)$  is contra  $\alpha\text{RPS}$ -continuous function.

The proof of step –ii- is similar to step-i-.

**Proposition (3-31):** Let  $f : (X, \tau) \rightarrow (Y, \rho)$  and  $g : (Y, \rho) \rightarrow (Z, \mu)$  be any functions. Then,  $g \circ f : (X, \tau) \rightarrow (Z, \mu)$  is contra  $\alpha\text{RPS}$ -continuous function if

- (i)  $f$  is  $\alpha\text{RPS}$ -irresolute continuous function and  $g$  is contra  $\alpha\text{RPS}$ -continuous function.
- (ii)  $f$  is strongly  $\alpha\text{RPS}$ -continuous function and  $g$  is contra  $\alpha\text{RPS}$ -continuous function.

**Proof (i) :-**

Let  $K$  be an open set in  $Z$ , since  $g$  is contra  $\alpha\text{RPS}$ -continuous. Thus,  $g^{-1}(K)$  is  $\alpha\text{RPS}$ -closed set in  $Y$ . Also, since  $f$  is  $\alpha\text{RPS}$ -irresolute continuous function, then  $f^{-1}(g^{-1}(K)) = (g \circ f)^{-1}(K)$  is  $\alpha\text{RPS}$ -closed set in  $X$ . Therefore,  $g \circ f : (X, \tau) \rightarrow (Z, \mu)$  is contra  $\alpha\text{RPS}$ -continuous function.

The proof of step –ii- is similar to step-i-.

Similarly, we proof of the following proposition.

**Proposition (3-32):-** If  $f : (X, \tau) \rightarrow (Y, \rho)$  and  $g : (Y, \rho) \rightarrow (Z, \mu)$  are any functions then,  $g \circ f : (X, \tau) \rightarrow (Z, \mu)$  is contra  $\alpha\text{RPS}^{\#}$ -continuous function if

- (i)  $f$  is  $\alpha\text{RPS}$ -irresolute continuous function and  $g$  is contra  $\alpha\text{RPS}^{\#}$ -continuous.
- (ii)  $f$  is strongly  $\alpha\text{RPS}$ -continuous function and  $g$  is contra  $\alpha\text{RPS}^{\#}$ -continuous.

**Proposition (3-33):-**

Iff:  $(X, \tau) \rightarrow (Y, \rho)$  is a contra $\alpha\tau s^\#$ -continuous function and  $g: (Y, \rho) \rightarrow (Z, \mu)$  is  $\alpha\tau s$ -continuous, then  $g \circ f: (X, \tau) \rightarrow (Z, \mu)$  is contra $\alpha\tau s$ -continuous function.

**Proof:** -Let  $K$  be an open set in  $Z$ . Thus,  $g^{-1}(K)$  is  $\alpha\tau s$ -open set in  $Y$ . Also, since  $f$  is contra $\alpha\tau s^\#$ -irresolute continuous, then  $f^{-1}(g^{-1}(K))$  is  $\alpha\tau s$ -closed set in  $X$ . But  $f^{-1}(g^{-1}(K)) = (g \circ f)^{-1}(K)$ . Therefore,  $g \circ f: (X, \tau) \rightarrow (Z, \mu)$  is contra $\alpha\tau s$ -continuous function.

**Proposition (3-34):-**

Iff:  $(X, \tau) \rightarrow (Y, \rho)$  is a contra $\alpha\tau s^\#$ -continuous function and  $g: (Y, \rho) \rightarrow (Z, \mu)$  is any function, then  $g \circ f: (X, \tau) \rightarrow (Z, \mu)$  is contra $\alpha\tau s^\#$ -continuous function if

- (i)  $g$  is  $\alpha\tau s$ -irresolute continuous function.
- (ii)  $g$  is strongly  $\alpha\tau s$ -continuous function.

**Proof (i):** Let  $K$  be an  $\alpha\tau s$ -open set in  $Z$ , since  $g$  is  $\alpha\tau s$ -irresolute continuous function. Thus,  $g^{-1}(K)$  is  $\alpha\tau s$ -open set in  $Y$ . Also, since  $f$  is contra $\alpha\tau s^\#$ -continuous function, then  $f^{-1}(g^{-1}(K)) = (g \circ f)^{-1}(K)$  is  $\alpha\tau s$ -closed set in  $X$ . Therefore,  $g \circ f: (X, \tau) \rightarrow (Z, \mu)$  is contra $\alpha\tau s^\#$ -continuous function.

The proof of step –ii- is similar to step-i-.

**Proposition (3-35):-** Iff:  $(X, \tau) \rightarrow (Y, \rho)$  is any function and  $g: (Y, \rho) \rightarrow (Z, \mu)$  is contra $\alpha\tau s^{\#\#}$ -continuous function, then  $g \circ f: (X, \tau) \rightarrow (Z, \mu)$  is contra $\alpha\tau s^{\#\#}$ -continuous function if  $f$  is

- (i) continuous function.
- (ii) strongly  $\alpha\tau s$ -continuous function.

**Proof (i):**

Let  $K$  be an  $\alpha\tau s$ -open set in  $Z$ . Thus,  $g^{-1}(K)$  is closed set in  $Y$ . Also, since  $f$  is continuous function, then  $f^{-1}(g^{-1}(K)) = (g \circ f)^{-1}(K)$  is closed set in  $X$ . Therefore,  $g \circ f: (X, \tau) \rightarrow (Z, \mu)$  is contra $\alpha\tau s^{\#\#}$ -continuous function.

The proof of step –ii- is similar to step-i-.

Similarly, we proof the following propositions.

**Proposition (3-36):-** Iff:  $(X, \tau) \rightarrow (Y, \rho)$  is any function and  $g: (Y, \rho) \rightarrow (Z, \mu)$  is contra $\alpha\tau s^{\#\#}$ -continuous function, then  $g \circ f: (X, \tau) \rightarrow (Z, \mu)$  is contra $\alpha\tau s^{\#\#}$ -continuous function if  $f$  is

- (i)  $\alpha\tau s$ -continuous function.
- (ii)  $\alpha\tau s$ -irresolute continuous function.

**Proposition (3-37):-** Let  $f: (X, \tau) \rightarrow (Y, \rho)$  and  $g: (Y, \rho) \rightarrow (Z, \mu)$  be any functions, then

- (i)  $g \circ f: (X, \tau) \rightarrow (Z, \mu)$  is contra $\alpha\tau s^{\#\#}$ -continuous function iff  $f$  is a contra $\alpha\tau s^{\#\#}$ -continuous function and  $g$  is  $\alpha\tau s$ -irresolute continuous.
- (ii)  $g \circ f: (X, \tau) \rightarrow (Z, \mu)$  is contra $\alpha\tau s^{\#\#}$ -continuous function if  $f$  is a contra $\alpha\tau s^{\#\#}$ -continuous function and  $g$  strongly  $\alpha\tau s$ -continuous.
- (iii)  $g \circ f: (X, \tau) \rightarrow (Z, \mu)$  is contra $\alpha\tau s$ -continuous function if  $f$  is a contra $\alpha\tau s^{\#\#}$ -continuous function and  $g$  is  $\alpha\tau s$ -continuous.

**Remark (3-38):-**

Here in the following diagram illustrates the relation between the contra $\alpha\tau s$ -continuous function kinds.
